

DIGITEK AI SUPPORT COPILOT

Part 1 — AI Support Automation Documentation

1. Project Overview

The Digitek AI Support Copilot is an AI-powered customer support workflow designed to automate repetitive email triage while escalating cases that require human judgement. The system receives customer emails, extracts structured information, classifies the request, determines urgency and confidence, logs the case, and routes it to the appropriate response path.

2. How the Automation Works

Gmail Trigger	Email Processing	AI Support Brain	Human Review Check
Category Router	Google Sheets	Customer Response	Human Escalation

- Classifies emails into the six required categories: Order status, Return/Refund, Product question, Bulk order, Complaint, and Spam.
- Extracts customer name, phone, email, order number and product when available.
- Assigns urgency and AI confidence.
- Creates a short factual summary.
- Determines whether human review is required.
- Logs cases in the Google Sheets Support Hub.
- Routes appropriate customer responses based on category.
- Handles spam without sending a normal support reply.

3. Human-in-the-Loop Logic

Human review is triggered when the AI cannot safely complete the request without additional information or human judgement. The prototype is intentionally designed not to guess when live business data is unavailable.

- Live order or tracking information is required.
- Live refund information is required.
- Product compatibility cannot be verified.
- Bulk pricing or stock availability cannot be verified.
- Important information is missing or ambiguous.
- The request is exceptional, high-risk, or strongly escalated.

4. Testing & Issues Encountered

- Email content needed to be cleaned/standardized so the AI could process the message reliably.
- Timestamp formatting was corrected in the workflow.
- Conditional routing required troubleshooting during implementation.

- An invalid email configuration occurred during testing and was corrected.
- The workflow was retested with a fresh email after the fixes to confirm the final configuration worked.

5. Limitations

- The prototype does not connect to Digitek's live order system.
- It cannot independently verify tracking information.
- It cannot verify live refund status.
- It cannot verify live inventory or pricing.
- It should not independently approve refunds or replacements.
- Product compatibility requiring unavailable product data is escalated to human review.
- The AI should never invent missing information or unsupported business claims.

6. Final Outcome

The final prototype demonstrates automated customer-support triage, structured information extraction, urgency and confidence detection, Google Sheets logging, category-based routing, automated acknowledgements, spam handling, and human escalation. The design focuses on reducing repetitive support work while keeping humans in control of decisions that require live information or judgement.

Tools: n8n • Google Gemini • Gmail • Google Sheets

Design principle: Automate the repetitive. Escalate the risky. Keep humans in control.
